The rejections

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 13 to 33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tamatsuka et al (6,162,708) in view of Iida et al.

The Tamatsuka et al reference teaches a silicon wafer and the process of producing a silicon wafer. The silicon wafer is made by a Czochralski process. A silicon crystal is pulled from a melt. The resultant crystal is heat treated after growth. The crystal is sliced to create the silicon wafer. The silicon is doped with nitrogen in the range of 1×10^{10} to 1×10^{15} . The oxygen concentration is less than 18 ppm, note entire reference. The sole difference between the instant claims and the prior art is the F/G.

Art Unit: 1765

However, the Iida et al reference teaches an F/G ratio in the claimed range when growing nitrogen doped silicon by the Czochralski process, note page 505. It would have been obvious to one of ordinary skill to modify the Tamatsuka et al reference by the teachings of the Iida et al reference to use a specific F/G in order to effect the properties of the crystal as the Iida et al reference clearly sets forth that F/G is a result effect parameter.
